Climate change is a growing global concern and has several long-term consequences for agriculture. While efforts are being made to mitigate the effects of climate change, it is crucial to understand the ways in which agricultural practices can contribute to climate change. This is particularly important in the context of organic agriculture, which has the potential to mitigate against the negative impacts of climate change. Research has shown that organic agriculture can be more adapted to climate change – with more soil organic matter, better soil cover, and greater biodiversity – and can help to sequester carbon. In addition, organic agriculture has the potential to mitigate against the effects of climate change. Market research showed that the majority of the organic sector can be as much as three times above the spot price. The project was initiated by Telkom, with financing from the Dutch Ministry of Economic Affairs.

Reisenshein, I. (2019). Organic Poultry. In I. Reisenshein (Ed.). Price information system for organic arable crops. Iran: organic nuts, (dried) fruits and saffron. The system was launched in February 2006. The first rei...
2,000 ha in conversion or already converted and there is a big potential for further expansion of organic agriculture. In Israel the estates of the Royal Family have been converted, in order to produce high-quality wine.

...AND ALSO VIEW FROM...

“...in the Netherlands, interest in quality products is growing. This offers the opportunity to reuse the long-standing passion for organic products through fair trade. This is being done through products as diverse as fair trade coffee, Umbrian fish and freshly caught, sustainably harvested, Scottish fish that is sold as Normandeur. We have had a long involvement with the Dutch organic sector and will continue to be active in supporting its development and growth. We aim to increase the proportion of domestic projects with our partners who are on the cutting edge,” says Peter.

With vision... Our most important goal is always to support motivated people to achieve their goals and to provide them with the opportunity to develop their professional capacities and their businesses. For our vision this means creating sound working relationships, based on trust, expertise, experience, knowledge and an attitude in which we work cooperatively with our clients to achieve the desired results. The company’s objective of significantly increasing the proportion of projects outside the Netherlands is an important and sustained growth in its projects, and of the company, for a number of years. We are committed to make a company with international reputation: “The organic world is an extraordinarily interesting and fast-growing world. These people have their own areas of work, certification and expertise in their initial projects and the demand for new materials different from demands today. The early work mostly concerned the conversion of fruit and building bridges along the supply chain from producers to the market.

The geographical focus of our work abroad has frequently changed, from central Europe and the Mediterranean in the eighties, to Latin America and Asia in the nineties.

Over the last 20 years Agro Eco has worked in almost all countries, helping introduce organic production and providing certifications and marketing skills as well as advisory and advocacy services. Agro Eco has gathered hundreds of farmers in the Netherlands, and thousands of farmers around the world, through the process of conversion to organic farming and with the marketing of their products. The geographical focus of our work abroad has frequently changed, from central Europe and the Mediterranean in the eighties, to Latin America and Asia in the nineties.

In the current decade the tropical activities are mainly located in Africa, with programming in five countries. These programmes consist of large-technique projects in which we focus on working with African farmers, advisors and retailers towards attaining higher incomes and more sustainable use of land and raw materials. We not only provide support throughout the production and fair trade but also bring about positive social and environmental benefits.”

Our involvement within the Dutch East is not at an end, but our projects there have been proves. In less we currently have a lot to be committed as already committed and there is a big potential for further expansion of organic agriculture. In Israel the estates of the Royal Family have been converted, in order to produce high-quality wine.

...AND PROSPECTS FOR THE FUTURE...

Developments often need time to mature in the organic world. In 1998 Agro Eco started with the activities in organic and sustainable fish breeding and selling. In the intervening years we have done research on the ecological and sustainable production of tropical shrimp and the Dutch Wadden Sea fishery. Seven years later, the first certified products from this latter project (Madagascar Sword) are in the stores and sustainably this project now is in American organic requirements. We expect to be able to sell these on success and to introduce a wide range of fresh and frozen fish products into the organic food chain in the coming years. Good things need time to grow. This is the main message of the organic movement. Agro Eco has served healthy, steady, and sustainable growth in its projects, and of the company, for a number of years. We are committed to make a company with international reputation: “The organic world is an extraordinarily interesting and fast-growing world. These people have their own areas of work, certification and expertise in their initial projects and the demand for new materials different from demands today.
